Breeding Records

This table shows the extent of breeding for each species. Breeding records include observations based on circumstantial evidence such as carrying food, dependent young, or even display behaviour, as well as more direct evidence such as having a Magpie nest on the site in which a family is raised throughout the breeding season. For the Australian Magpie, for example, there were 763 breeding events recorded. That is, during

the week being observed, at least once there was some evidence of breeding. Australian Magpies were observed breeding at 196 of the 356 sites in each of the 27 years of the survey. The Ratio statistic is the percentage of breeding events per sighting, or the number of sightings divided by the number of breeding events, converted to a percentage. For the Australian Magpie this is 763/1700 which approximates to 45 percent.

Australian Magpie	Rank	Species	No of Breeding Records	No of Breeding Sites	No of Breeding Years	Ratio %
